

a. As a sudoku player, I want to check if a puzzle has no solutions.

b. The solve sudoku puzzle use case will solve any puzzle txt file given to it and display the solution or its lack of one to the terminal.

c. User provides puzzle file(s) → program checks file validity → program solves and outputs the solution(s) to the terminal

d. 1. User provides puzzle file(s):
• player runs ./Assignment4.exe {puzzle files here}
2. Program checks file validity
• if file doesn't exist → notify user → end program
• if file contents aren't applicable to a 9x9 grid → notify user → end program
3. Program solves and outputs the solution(s) to the terminal
  • program solves given sudoku puzzle(s)
  • if solution(s) exist → print file name, original puzzle, solved puzzle
  • no solution(s) exist → print "No solution found"
